

Arduino Due to Tesla Model S/X module BMS

Physical table order • one 6S module • EVTV two-module harness • BMB powered from Due +5 V

BENCH-TEST LIMITATION

U2 is an I²C MOSFET shifter with 10 kΩ pull-ups. At 612.5 kbaud it may have slow rising edges, especially with the 24-inch harness. Do not rely on this prototype interface as the only charge/discharge protection.

Power the Due normally through USB or VIN; use its +5 V header as an output here. This is UART-like serial, not CAN. Before power-up, verify the harness revision and J2 cavity numbers with a continuity meter. No 120 Ω terminator is used.
